010 **ABSTRACT**
011

012 Essay critiques refer to the textual assessment of an essay, serving as the basis for
013 the grading of the essay, and are also crucial for the improvements of the essay.
014 Essay critique generation has received increasing attention after the blooming of
015 large language models (LLMs), which show promising potential in writing and
016 critiquing essays. However, current LLMs suffer from hallucinations when gener-
017 ating essay critiques (e.g., baseless criticism), which are still under-explored in the
018 community. To facilitate research in reliable essay critique generation, we first de-
019 fine this task with a unified input-output format as well as clear evaluation criteria.
020 To minimize hallucinations in critique generation, we introduce RedHat, a novel
021 approach that embeds the key information from an essay directly into the gener-
022 ation process through document-level question-answering, ensuring critiques stay
023 firmly anchored to the evaluated content. We collected a large-scale, high-quality
024 essay critique dataset called *EssayC*, annotated by human experts over multiple
025 LLM-generated critiques, from an undergraduate essay writing course. We ex-
026 perimented RedHat backboned by commercial and open-sourced LLMs. Results
027 showed that critiques generated by RedHat are preferred by auto-judger and hu-
028 man experts over baseline in around 20% of cases on *EssayC* in ambiguity and
029 informativeness, with a decrement around 10% on hallucinations under our eval-
030 uation criteria.

031 **1 INTRODUCTION**
032

033 Essay critiques are pivotal for grading writings (Triawan et al., 2023; Suresh et al., 2023; Wang
034 et al., 2018), providing constructive feedback (Abbas & Herdi, 2018) and improving writing
035 skills (Noroozi et al., 2023). With the advancement of large language models (LLMs) (Ouyang
036 et al., 2022; Rafailov et al., 2024; Ethayarajh et al., 2024), LLM-as-a-judge (Zheng et al., 2024a)
037 based critique models have shown promising results in providing explainable and informative cri-
038 quites in instruction following tasks (Ke et al., 2023; OpenAI, 2024a). Although applying LLMs in
039 essay assessment seems promising, our study found that LLMs are plagued by hallucinations when
040 generating essay critiques and therefore not suitable for direct application.

041 Hallucination in LLMs refers to the phenomenon that the generated content is not grounded on
042 factual or correct information (Rawte et al., 2023). Figure 1 presents hallucinations from GPT-
043 4o (OpenAI, 2024b) generated essay critiques. It exhibits two typical types of hallucination in this
044 task: (1) providing advice that is not appropriate nor does not match the essay content, and (2)
045 proposing fallacies that do not exist in the assessed essay. These hallucinated critiques significantly
046 hinder the usability of LLM in essay critique generation.

047 Existing research focuses on instructing LLMs to automated essay scoring (AES) (Kundu & Bar-
048 bosa, 2024), yet improving critique quality is still under-explored. Lack of consensus on how to
049 evaluate an essay in detail leads to such negligence in critique improvement. First, the essay is a
050 form of open-ended generation (Brahman et al., 2022), ranging from narrative to argumentative, each
051 with distinct purposes. Detailed requirements differ between writing an analysis part and a conclu-
052 sion part. This complicates the detailing of assessment criteria in the evaluation prompt, leading to
053 the fact that type I hallucination in Figure 1 often happens. Unfortunately, human expert evaluation
is extremely costly and inefficient (10 seconds for LLMs versus half an hour for human) for assess-

Figure 1: **Essay critique hallucination explained.** Here we listed two typical hallucinations caused by LLM’s overly following evaluation criteria in the prompt of the whole essay when using GPT-4o-mini to generate essay critique. In the case of **Type I** hallucination, we find that GPT-4o-mini is overly criticizing a conclusion part using descriptions from the criteria. In the case of **Type II** hallucination, GPT-4o-mini does not capture the author’s argument expressed in complex format and presented in the beginning. GPT-4o-mini is fed with the whole essay and criteria. The prompt for generating critique is listed in Appendix I.

ment both for essays and critiques, causing a lack of research resources, especially for the detection of Type II hallucination in Figure 1. These factors hinder the understanding and de-hallucination of LLM-generated essay critiques.

In response to the lack of resource challenges, we start with an undergraduate writing training course. We regard such scenarios as a generalizable scene of essay critiquing, with abundantly available expert annotations. In our preliminary study of the application of LLMs in such a course, we found that the LLM hallucination behavior in essay critiques is closely related to two factors: (1) misinterpretation of the essay, and (2) over-exaggeration of a certain standard in the criteria. These factors plague the LLM with hallucinations in following the critiquing prompt.

Based on the findings above, we propose RedHat (Reduce HallucinaTion), to reduce the loss of credibility in LLM-generated essay critiques caused by hallucination. We noticed a widely adopted assessment technique for humans (Marton & Säljö, 1976; Chung et al., 2023), that embodies the abstract concept of understanding an essay into the concrete practice of answering questions based on it. We consulted essay experts to identify crucial questions that often need to be clarified for a thorough understanding of an essay. The answers to these questions were beneficial to facilitate the LLM’s comprehension of the essay’s structure and the author’s arguments. This approach ensures that the model recognizes the function of each paragraph within the overall context of the essay, reducing the risk of generating hallucinations caused by overly following evaluation instructions. These question-answer pairs were embedded into the evaluation prompt, providing additional grounding information for the essay during the generation process

We compare accessible alignment techniques including post-pretraining on long contexts and supervised finetuning with RedHat. We suggest the generalizability of RedHat across different base-LLMs, languages and writing genres. We show that alignment would cause more hallucinations on synthetic training data constructed out of human experts’ critiques. This indicates the source of such new hallucinations. In our evaluation setting, RedHat augmented LLM is consistently preferred by human annotators compared to baselines. We utilize the optimized critiques as guidance for essay improvement. In our machine-aided refinement setting, the polished content is generally preferred by human annotators. These showed the potential of our method in relieving hallucination in critiques, thus providing essays with informative and practicable help.

Table 1: **A Brief Comparison with Previous Work.** We conclude between the scope that AI feedback covers(**Granularity**), assessment content (**Target**), content length (**Writing Len**), AI feedback format, length and whether the works’ dataset, method and evaluation results are publicly available (**Open Sourced**). Our work integrates a fine-grained perspective towards this field.

2 FINE-GRAINED ESSAY CRITIQUE GENERATION

2.1 CREATION OF ESSAYC

Our task is to leverage Large Language Models (LLMs) to automate the generation of critiques for the drafts of undergraduates’ argumentative essays. The goal is to provide students with meaningful feedback that aligns with the detailed feedback provided by the instructors, so as to help the students improve their writing before final submission (**critiquing**). Most previous works studies whether LLM feedback for essay **scoring** (Tang et al., 2024), distinguish the quality of paired abstract (Liu & Shah, 2023) or **trait scoring** in conference review (Tyser et al., 2024). Our evaluation criteria including topic, literature, arguments and structure, language, and norms can be inspected in Appendix C. As summarized in Table 1, this work distinguishes itself from previous work mainly from types and granularity from the LLMs, the assessed target and more importantly, the shift from scoring to critiquing.

In order to provide a unified, even and reproducible test-bench for such task, we curated EssayC addressing such task and concerns. EssayC randomly collects undergraduate essays whose topics cover *Environment Science*, *Biological Science*, *Software Engineering*, *Game Industry*, *Earth*, *Social Science*, *Journalism and Communications*, *Economics*, *Humanities*, *Literature Comments*, and so on. Most science, engineering and humanity and social science are covered. Human comments may be incomplete in grammar and organization. We used GLM4-130B to refine and complete their grammar and structure based on the human comments. As a result, 36 essays are randomly picked out of the above process under each field topics. The leftovers are beneficial as training data for supervised fine-tuning.

To enhance quality, we asked the annotators to read through the teacher’s critiques in the paragraph and filter out unqualified ones, such as those with only punctuation marks or subjective comments expressing unrelated feelings. Then we devised a raw critique-quality classifier on GLM-4-9B to auto-filter the leftovers in the train data section. Critique numbers drop from 675 to 395 in the test set, and from 51238 to 31694 in the training set after filtration. The statistics can be found in Table 2 column 2.

2.2 ESSAY CRITIQUE GENERATION TASK DESCRIPTION

Paragraph-level feedback is an effective granularity for improving written content since it can effectively help authors localize the problem while maintaining most contextual information. In contrast, sentence-level feedback can sometimes be less meaningful because not every sentence in a text

	EssayC	English

Table 2: **Statistics about EssayC.** **Avg** is short for average. **Para** is short for paragraphs. **Tea** is short for teachers. **Cri** is short for critique. **English** stands for the English subset of conference papers used in experiment.

162 requires revision, nor are writing problems typically confined to a single sentence. We focus on es-
163 say assessment for pedagogical purposes, mainly helping novice writers improve their writing with
164 detailed and informative critiques, and we formulate the task as follows.

165 **Task Formalization:** Given an essay \mathcal{E} , a set of instructor evaluation criteria Γ , and the paragraph
166 \mathcal{P} to be critiqued, a model f (e.g., an LLM) is required to generate a critique c for that paragraph:
167

$$c = f(\mathcal{E}, \Gamma, \mathcal{P}) \quad (1)$$

170 **Objective:** The goal of this task is to generate critiques that meet three essential criteria. First, the
171 critique should be free from **hallucination**, and accurately interpret the author’s viewpoints and the
172 factual evidence in the text without introducing inaccuracies. Second, it must be **detailed**, demon-
173 strating a thorough understanding of the paragraph under evaluation, rather than providing vague or
174 superficial feedback. Finally, the critique should be **informative**, offering meaningful insights that
175 assist authors in improving their writing. To maintain clarity and readability, we stipulate that com-
176 ments must be limited to a maximum of 100 words in our study. Formally, the generation of critique
177 c should maximize the **informativeness** $\mathcal{U}(c)$ and **Ambiguity** $A(c)$ while minimizing **hallucination**
178 $H(c)$, subject to the length constraint:

$$\max_c \quad \mathcal{U}(c) - A(c) - H(c), \quad \text{subject to } \text{Len}(c) \leq 100 \quad (2)$$

181 This constrained problem reflects the trade-off between reducing hallucinations and increasing de-
182 tail, with the ultimate goal of optimizing the informativeness of the feedback provided to the writer.
183

184 3 HALLUCINATION IN ESSAY ASSESSMENT

185 We conducted an empirical study using students’ feedback on LLM-generated critiques. Students
186 give textual judgments over randomly presented critiques to their essays generated by LLMs in-
187 cluding ChatGLM3-6b, GLM-4 Plus API (Du et al., 2021; GLM, 2024), and ChatGLM3 finetuned
188 on the instructors’ comments. We found that most prominent issue is hallucination in critiques, as
189 reported to be “the generation of plausible looking yet factually incorrect statements” from (Bang
190 et al., 2023).

191 As (Maynez et al., 2020) defined *Extrinsic Hallucination* as “ignoring the source material alto-
192 gether” and *Intrinsic Hallucination* as “misrepresenting information from the document” in summa-
193 rization task, we found the hallucination in generated essay critiques can be divided mainly into two
194 types as follows:

- 195 • **Type I:** Criticizing writing fallacies that do not exist in the essay. As the cases in Table
196 3 show, LLM emphasize some baseless errors. This type shares commonalities with the above
Extrinsic Hallucination.
- 197 • **Type II:** Overemphasizing details and reversal of priorities in argumentation structures.
198 The primary concern lies in the tendency to recommend inclusion of excessive details,
199 which consequently undermines the clarity and conciseness of the argument. This diverts
200 from the actual intent proposed in the criteria and the essay. This type is partly related to
Intrinsic Hallucination.

201 Under the two main types of hallucinations, we discuss the specific manifestation of them. As listed
202 in Table 3, ignoring the context information, or misunderstanding authors’ perspective originate
203 from **Type I** hallucination. Overreaction and Over-elaboration originate from **Type II** hallucination.
204 These consist of the major aspects for human judgment of critique quality in experiments, such as
205 Table 4 and Appendix H.

206 We also observed that the occurrence of hallucination varies depending on the position of the critiqued
207 content within the essay. The conclusion part of the essay exhibits the least amount of hallucination,
208 whereas the body sections exhibit the highest incidence. Figure 3 illustrates the human scoring of
209 critique quality, primarily based on the extent of hallucination. Hallucinations are most pronounced
210 in the essay sections ranging from positions between 0% to 30% and around 80% with respect to the
211 total essay length, indicating that LLMs struggle particularly in these areas.

Hallucination	Description	Example Cases	Type
Ignoring context info	Overlooked the contextual information, failing to notice the perspectives and evidence the author has already provided in the surrounding text	(critiquing conclusion part) This section provides background information on "carnivalization"; however, it is somewhat lacking in argumentation and support for the viewpoint.	Type I
Overcorrection at the word or sentence level	Incorrect correction of words or phrases, or overcorrection	In addition, the argument lacks detailed support, and terms such as "universality" and "social attributes" are not thoroughly explained. (no need for explanation)	Type II
Misunderstand the author's perspective	Failed to understand the author's perspective in the evaluated paragraph and its connection to the article	The evaluated paragraph is fairly clear in terms of structure, laying the foundation for subsequent analysis by explaining the 4C marketing theory ... (which is not the author's intention)	Type I
Over-elaboration of non-essential information	Overemphasizing details, reversal of priorities in structures	(already presented evidence) ... further specific evidence is needed to support its conclusion, particularly in clarifying how these strategies hindered technology sharing.	Type II
Citation-related error	Incorrect identification of citations or mistaking the citation for the object of evaluation	The evaluated paragraph has logical issues in its argumentation. The author rejects the definition of health based on "bodily integrity ... (which is the citation part view)	Type I & II
Vague assessment	Copying words from evaluation criteria, with no in-depth revision advice	The argument in this paragraph is relatively clear. However, the supporting evidence appears somewhat limited. And ...	Type II

Table 3: **Hallucination in LLM essay critiques:** the red background texts are the hallucination part and the blue comments are explanations.

4 REDHAT REDUCES HALLUCINATION IN CRITIQUES

4.1 BACKGROUND

As we have discussed above, the hallucination in essay critique generation mainly originates from LLMs' un-faithfulness to the essay. LLM is not fully aware of the essay contents, leading to the generation problems when it tries to align with the evaluation criteria.

To bridge the gap between LLM's the faithfulness of the essay and the following of assessing prompt, we propose RedHat. We noticed the phenomenon in education and psychology (Marton & Sääljö, 1976), that breaking the understanding task into question-answering task is able to speed up human's comprehension of long documents. There is an opportunity to ease the evaluation instruction by switching it into series of questions. Then by finding answers from the essay, LLM can reduce its hallucination by more factual information.

4.2 CRITERIA EMBODIMENT

Following the idea above, we embody the evaluation criteria Γ into a list of questions. To ensure the questions' relevance, we prompted GPT-4 to propose questions conditioned on Γ and the essay content. The questions shall cover the essence of Γ , the above process has to be repetitive to be exhaustive. Formally, denote \mathcal{E} as the essay, \mathcal{P} as the critiquing paragraph, p_{question} as prompt for this task, questions are produced in the following iterative process:

$$q_n = \text{Question}_\theta(\Gamma, \mathcal{E}, p_{\text{question}}, q_{1:n-1}) \quad (3)$$

The number of questions n is a hyper-parameter. The above process is not economic in reality, with repetition for each new essay exhibiting redundancy on common questions. We repeat the experiments with different essays and pick a list of common questions as the general solution. The questions are reviewed by human writing experts, listed in the Appendix E.

Another important part of criteria decomposition is seeking answers to those questions in the essay. Fortunately, current LLM techniques all showed compelling performance on DocQA and long

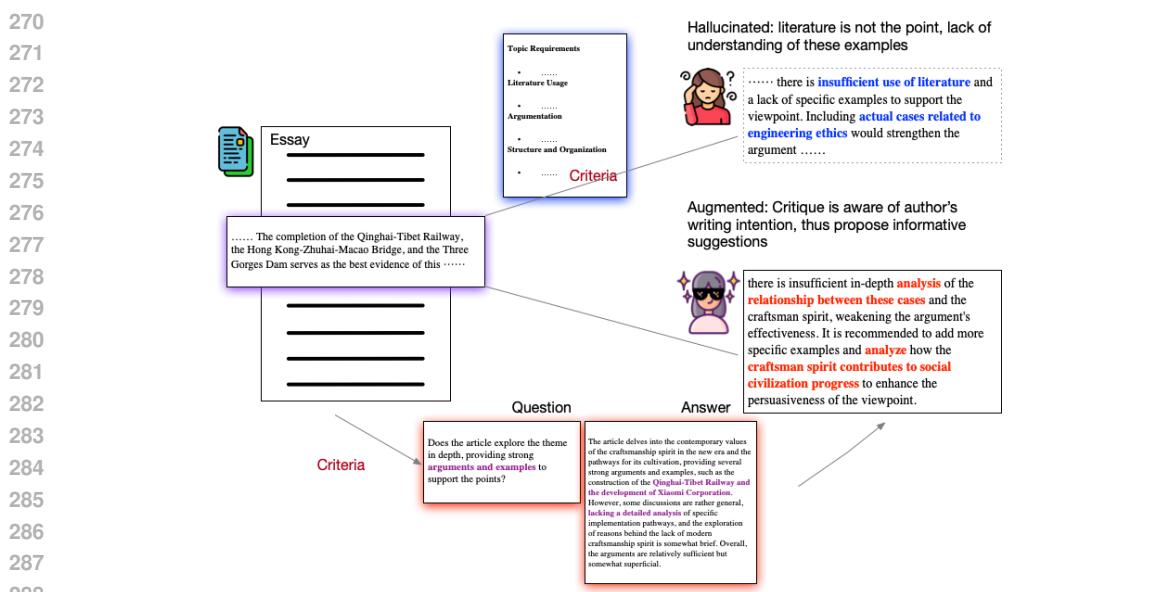

Figure 2: **RedHat Explained.** Converting essay evaluation criteria into a question checklist is beneficial for critique generation. Directly following criteria would ignore the understanding of the essay. RedHats designed to reduce hallucination and ambiguity, and improve critique informativeness. RedHat engages necessary information for understanding the essay in question-answering pairs into the critique generation prompt.

context retrieval (Lewis et al., 2020). The answering process can be streamlined into a separate document question-answering process as formalized below:

$$a_n = \text{DocQA}(q_n, \mathcal{E}) \quad (4)$$

4.3 REORGANIZING THE CRITIQUING PROCESS

We state that the direct insert of the question-answering result pairs into the critiquing process is enough to mediate LLM hallucination in critiquing. One of the most practical methods for combining QA results like RAG (Lewis et al., 2020) calls for a domain-specific retriever for such a situation. Though shared with a promising goal to reduce hallucination (Shuster et al., 2021), our task differs from RAG in contents. RedHat tries to rectify LLM’s inability to grasp and understand the whole essay, while an essay is presented in the original inputs. RAG supplements external knowledge to relieve the ignorance of LLM knowledge, and usually the knowledge does not explicitly exist in original inputs.

We ground the question-answering results into the original critique generation prompt, as the below formula reveals:

$$c_n = \text{LLM}_C(\Gamma, \mathcal{E}, \mathcal{P}, \{q_i, a_i\}_{i=1}^n, p_{\text{critique}}) \quad (5)$$

5 EXPERIMENTS

5.1 EXPERIMENT SETUP

Dataset: We mainly experiment RedHat on EssayC discussed in section 3. To validate RedHat’s effectiveness, we additionally picked a subset from artificial intelligence conference papers as previous works with English-dominated LLMs did. We intentionally chose those papers containing less formulas and illustrations, and more importantly, ensuring the paper authors’ are accessible so that they could judge the quality over the generated critiques. We pick 10 paragraphs with longer word counts from each paper to be critiqued. The statistics of the English subset is listed in Table 2.

	Overall (↑)	Hallu% (↓)	Ambig% (↓)	Info% (↑)
Human Critiques	3.387	47.34	11.65	30.63
Qwen-2-7b-Instruct	3.187	62.53	14.68	11.90
+ 5-shots	3.178	<u>61.01</u>	11.14	12.66
+ RedHat	<u>3.267</u>	62.03	7.59	<u>15.70</u>
+ RedHat-weak	3.323	58.73	<u>8.10</u>	18.73
+ PT	2.777	71.65	24.30	-9.11
+ SFT	2.615	74.43	27.59	-19.24
+ SFT+RedHat	2.636	77.72	22.28	-10.63
glm-4-9b-chat	3.190	65.99	14.97	<u>6.60</u>
+ RedHat	3.327	63.96	9.64	13.20
+ RedHat-weak	<u>3.246</u>	<u>65.99</u>	<u>13.45</u>	6.35
+ PT	3.053	69.04	23.86	-3.04
+ SFT	2.503	79.44	16.50	-31.72
+ SFT+RedHat	2.574	79.44	14.47	-27.92
ChatGPT-4o	2.448	76.92	11.99	-9.99
+ RedHat	3.549	42.96	8.99	23.98

Table 4: **Main experiment** on EssayC (GLM-4 and Qwen-2) and English subset (ChatGPT-4o). All results are judged by human experts. **Hallu** is short for hallucination (0-100%). **Ambig** is short for ambiguity(0-100%). **Info** is short for informativeness(-100-100%). Due to the discriminating ability of human, the three dimensions are evaluated in human detection of fallacies or goodness. Beside the three dimensions, an **Overall score** is given mainly based on hallucination based on the number of deficits detected.

Base LLMs: To validate RedHat’s effectiveness in more LLMs, we select GLM-4-9B-chat (GLM, 2024) and Qwen-2-7B-Instruct (Qwen, 2024) to be studied on EssayC. We select ChatGPT-4o to study the English conference paper subset.

Baselines: Since there are plenty of human written critiques in EssayC construction, supervised-finetuning (SFT) is a direct baseline method. **SFT** tries to show whether it is applicable to avoid hallucinating from direct learning from teachers’ critiques. **Post-pretraining (PT)** tries to clarify our doubt about whether hallucination originates from alienness to long document form reading. **Few-shot** tries to explore the feasibility of bypassing hallucination with in-context examples. Details for few-shot, training and data preparation can be found in Appendix F. Additionally, we also apply RedHat to the supervised finetuned model, to investigate its further application. We are also interested in the quality of answers to the RedHat questions, therefore we compared the LLM self-generated answers in inference (**Weak**) and GPT-4 generated answers.

Metrics: Each of the critique is evaluated with four dimensions: hallucination, ambiguity, informativeness and overall. **Hallucination** ($\downarrow 0 \sim 100\%$) is evaluated by the true or false detection rate. If one falls to fit the 6 hallucination types mentioned in Table 3, it is marked as true in hallucination. **Ambiguity** ($\downarrow 0 \sim 100\%$) is calculated whether the critique is ambiguous or not. **Informativeness** ($\uparrow -100 \sim 100\%$) is calculated whether the critique provided useful improvement advice for polishing. They scored three levels of informativeness: of positive help, of no help, of negative help. **Overall score** ($\uparrow 0 \sim 5$) models the task target in Formula 1, and is calculated through: (1) minus 2 per hallucination found; (2) minus 1 for ambiguous; (3) minus 1 for being of negative help or plus 1 for being of positive help (4) truncate into interval 0 to 5.

Evaluator: We mainly refer to trained human graduate teaching assistant scores as evaluation results. The details of our human annotations are listed in the Appendix H. We also conducted pairwise preference annotation with base-LLM and RedHat generated critiques. In this scene, human ranks two critiques into which is better or both is good or bad. Each generated comment is annotated by two graduate teaching assistants. In case of discrepancies, a third graduate teaching assistant makes the final decision. Our overall Inter Annotator Agreement is 0.71 in GLM-4 and Qwen-2 as a whole, ensuring annotation consistency and reducing random interference. We also utilized GPT-4o as auto evaluation method to explore the accessibility of automatic evaluators.

378
379

5.2 MAIN RESULTS

We showed the results in Table 4, with Qwen-2-7B, GLM-4-9B, ChatGPT-4o. Statistics from the RedHat (**Orange** background) showed increments in all dimensions compared to base-LLMs. Few-shot benefits the base Qwen2 but is less evident compared to RedHat. However, SFT and PT cause decrement in all dimensions, indicating that direct adjust LLM parameters in the aim of fitting MLE loss are not solutions to hallucination reduction in essay critique generation. Additionally, the reduction of hallucination usually correlates to the reduction of ambiguity and the increment of informativeness. Last but not least, considering RedHat and RedHat-weak, answers provided by GPT (regarded as an DocQA oracle for its high accuracy) or LLM itself all contributed to hallucination reduction and overall improvement.

Figure 3 depicts a dynamic relation between the critiqued piece and its position in the essay. In the **Orange** box, RedHat mainly relieved the hallucination in this part. At the 80% point of the article, we observe a notable decline in performance across all methods, as the **Green** box highlights. We hypothesize that this is where the author begins to conclude their argument, rather than continuing to elaborate further. At this stage, the model tends to overextend by providing more detailed explanations than necessary.

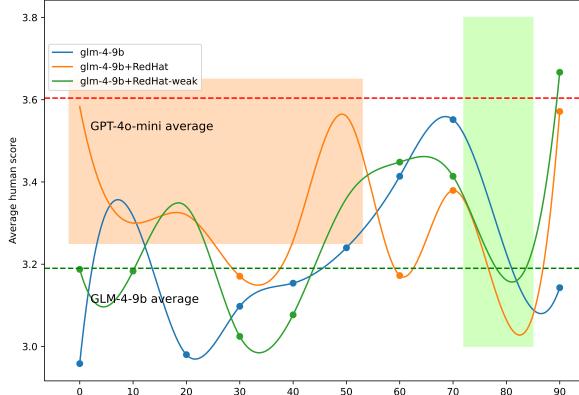

Figure 3: **Distribution** of overall scores with the **position** in the article. The x-axis shows the relative length of the annotated text to the essay. The y-axis shows the average overall score by a human.

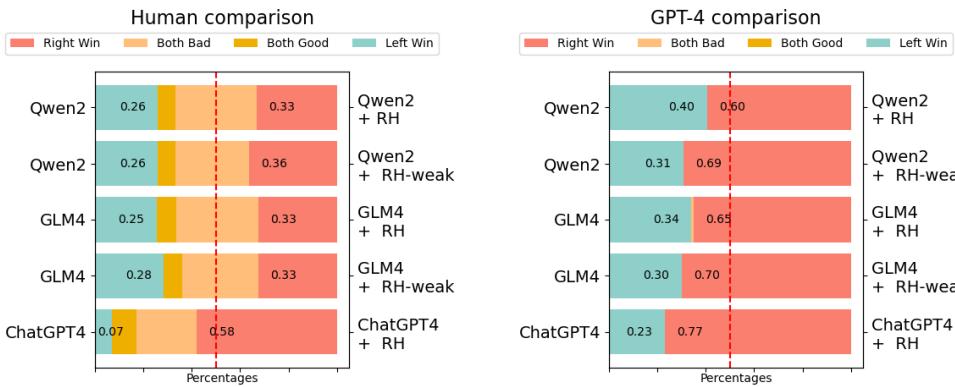

Figure 4: **Results from comparison of critiques generated by baseline with our methods.** Both human experts and GPT-4o judgements are plotted. **RH** is short for RedHat.

The comparison between baseline-LLM and RedHat are shown in Figure 4. In the figure, human are more preferred to critiques generated by RedHat by $\Delta 7.11\%$ in GLM, 10.36% in Qwen. On the one hand, the high tie rates in human judgments result from the number of hallucination types. If one of the six hallucination types is detected from each of the critiques, the pair would be graded as *both is bad*. On the other hand, GPT-4o as comparison evaluator showed low *tie rate*, indicating its potential bias or unawareness of hallucination. Appendix G contains a detailed discussion of them. In conclusion, the overall trend of GPT-4o judgments matches with human judgments and shows the improvements from .

Table 5: Overlaps between generated critiques and questions. R-L is short for Rouge score calculated with longest common substrings. B-1 is short for BLEU score calculated with unigrams.

5.3 How QAS HELP REDUCE HALLUCINATION?

To explore how QA results assist in comment generation, we designed the following analytical experiments to investigate the impact of QA accuracy on outcomes and the overlap between the generated critiques and the QA.

Question-Answer Quality: We evaluate the validity of questions by analyzing the similarities between critiques, questions and answers. We calculated word-level overlapping with **ROUGE** (Lin, 2004) and **BLEU** (Papineni et al., 2002), and semantic similarity with **BLEURT** (Sellam et al., 2020), **BERTScore** (Zhang et al., 2019), between the generated critiques and the corresponding questions list, answers list, as shown in Table 5.

We can observe several findings from the results in Table 5. First, with RedHat, similarities between generated critiques and questions do not significantly increase, indicating the questions are not leaking the desired contents to the LLM. Second, similarities gain with answers is observed, especially with Qwen + RedHat, showing that detailed information about the essay is conveyed in the answers by RedHat.

Answer Accuracy Influence on Performance: In our methodology, we assume that the responses to the questions are correct, which are generated by a perfect long-document question-answering model. We invited human essay evaluation experts to score the correctness of answers for the questions on different essays. GLM-4 show a 14.4% error rate, followed by 7.8% from Qwen-2 and 4.4% ChatGPT-4o. The decrease in error rates corresponds to the gain in point-wise scoring (RedHat-weak rows) of hallucination and pairwise comparison. However, the overall influence of RedHat still outperform baseline-LLMs, suggesting the robustness of our method.

5.4 HOW UPDATED CRITIQUES HELP WITH ESSAY POLISH?

Comment generation needs to serve the educational context, meaning it should assist students in improving their essay quality. We designed an experiment to verify that the comments generated by the RedHat can better help improve text quality.

We selected 100 essay samples from the test set and paired the comments generated by glm-4-9b-chat and glm-4-9b-chat-RedHat. We used GPT-4o as a professional text enhancer, prompting it to

	GLM-4 v.s. GLM-4-RedHat			
	Win	Tie	Lose	Δ
Human	45.74	5.32	48.94	3.20
GPT-4o	19.56	58.67	21.78	2.22

Table 6: Critique Effect on Essay Polish. Preference picking between through human and GPT-4o-0815.

	glm-4-9b-chat	glm-4-9b-chat+RedHat
486		
487	Paragraph	The renovation of Juer Hutong involves two key aspects: one is addressing planning issues from the perspective of a historically and culturally significant city, and the other is dealing with residential design from the standpoint of urban design. In terms of historical and cultural city planning, there are two main issues: first, the facade is inconsistent. The upper floors of No. 41 Juer
488		Hutong are white , which appears out of place against the primarily gray hutong landscape. Second,
489		multi-story buildings still disrupt the traditional hutong atmosphere to some extent. Although the
490		three-story buildings in No. 41 maintain the traditional courtyard-style rooftops, preserving the ur-
491		ban texture from an aerial view, from within the hutong, the height of the buildings blocks the view,
492		offering an experience similar to that of high-rise residential complexes.
493	Critique	This paragraph has issues with its struc-
494		structural organization. The main argu-
495		ment at the beginning is not entirely
496		consistent with the discussion in the
497		latter part, which disrupts the logical
498		flow of the text. It is recommended to
499		revise "The renovation of Juer Hutong invol-
500		ves two key aspects" to "There are two issues
501		in the renovation of Juer Hutong: first, the
502		planning of the historical and culturally sig-
503		nificant city, and second, the urban design."
504	Overall	2.0
505	Reasons	Over-correction at the word or sentence level; of no use
506		provided informative suggestions
507		
508		

509 Table 7: Example between the quality of two critiques by glm-4-9b-chat and glm-4-9b-chat +
510 RedHat. Already translated into English from the original Chinese texts.
511
512

513 revise the annotated text based on the comments. Finally, we invited master and doctoral students,
514 as well as teachers from the humanities, to compare the quality of the revised texts. The results are
515 shown in the Table 6. From the results, it is evident that our method, using GPT-4o as the enhancer,
516 can effectively generate in-depth comments and improve text quality. Also, we find that there is a
517 huge gap between human evaluation and GPT-based automatic evaluation. Which is another hint on
518 the unexposed bias inside LLMs.
519
520

521 5.5 CASE STUDY

522 We pick one case from a certain student essay titled “Why was the renovation of Ju’er Hutong
523 highly praised but not widely promoted”. In the specific paragraph presented, the author made an
524 abrupt twist in conveying from “the two aspects of renovation” to “two main issues of historical and
525 cultural city planning”. Although glm-4-9b-chat points out the structural issues in it, it mistakenly
526 focuses on the revision of the terms. On the other hand, glm-4-9b-chat with RedHat recognized
527 the issue and provided suggestions to outline the main argument. This benefits the coherence both
528 in the paragraph and the essay, showing the augmentation of the LLM’s ability against hallucination
529 caused by local phrases.
530
531

532 6 CONCLUSIONS

533 In this work, we proposed RedHat, an effective method for reducing hallucinaiton in LLM-
534 generated critiques in essay assessment. RedHat enhanced GLM-9b-chat, Qwen-2-7B-Instruct
535 and ChatGPT-4o by adding an essay-level digest in a question-answering format for the LLM. In
536 our pedagogical application setting, results showed that our method reduced hallucination, ambi-
537 guity and improved their informativeness. On the other hand, our generated critiques also greatly
538 helped polish the original essay content. The method is both effective in reducing the hallucination
539 both with EssayC and with the English conference papers.

756 A EXTENDED DISCUSSION OF RELATED WORK
757

758 A.1 HALLUCINATION DATASOURCES
759

760 The hallucination in natural language generation task is generally defined as the phenomenon that
761 model generated contents contain information that contradicts or is unfaithful to user instructions,
762 additional background context, and/or factual knowledge. Various previous studies have attempted
763 to mitigate hallucination problem in enormous traditional NLG tasks. Due to their discrepancy in
764 task formats, nevertheless, these works define hallucination in rather different ways and aspects and
765 design methodologies tailored to solving these problems in concern. In conversation tasks, (Zhang
766 et al., 2018) proposed PersonaChat dataset aiming to relieve the problem of self-consistency violation
767 in chit-chat. (Dinan et al., 2019) attempts to incorporate external knowledge corpus for more
768 factual knowledge-based dialogue generation. In abstractive summarization tasks (a most related
769 domain of our task), efforts have been paid to alleviate the hallucination problems embodied as gen-
770 erating spans not entailed by the source text. Early works explores methods to improve factuality
771 from source content understanding (Huang et al., 2020), training process (Cao & Wang, 2021) and
772 post-training phase (Dong et al., 2020).
773

774 A.2 HALLUCINATION DETECTION
775

776 Such method needs external knowledge sources, or reference answer for judging. There are also
777 pioneers who invented reference free methods. FEWL(Wei et al., 2024) weights multiple LLMs
778 answers as proxy of golden answers, which theoretically provided plausibility for judgment. (Hou
779 et al., 2024) utilizes the belief of LLM to check their hallucination problem via decomposing state-
780 ments into child statements to check in a hierarchical way.

781 Essay evaluation is both reference and knowledge sparse task, making it hard for quantification on
782 judging. Our method inherits the above ideology by embodying the concept of faithfulness to essay
783 as correctly performs the docOA task.
784

785 A.3 HALLUCINATION CAUSES
786

787 The causes of hallucination on knowledge-intensive tasks are various. Previous works have focused
788 on those arising from deficiencies in data collection and preprocessing, training, and inferencing
789 phases. In terms of data sources, the emergence of hallucination could be attributed to incorrect or bi-
790 ased data, absence of real-time or proprietary knowledge, or wrong utilization of knowledge (Huang
791 et al., 2023). In the training phase, (Sharma et al., 2023) shows that the training process of RLHF
792 may wrongly lead LLM to produce content that flatters users but disobeys facts. In the inference
793 phase, (Wang & Sennrich, 2020) claims that the discrepancy between the training and inferencing
794 pattern of the AR model could lead to hallucination. (Zhang et al., 2023) finds that hallucinations
795 already generated can mislead LLM to continue producing error statements.
796

797 In our work concerning hallucination in essay evaluation tasks, hallucination could be caused by
798 more complex factors. Due to blurred or even seemingly contradictory criteria of judgment, eval-
799 uators could generate outputs not consistent with previous contents, likewise tending to generate
800 tangential evaluations.
801

802 A.4 ESSAY CRITIQUE GENERATION
803

804 Utilizing LLMs to judge and refine human writing has become a buoyant application of recent LLM
805 systems. Several systematic evaluations have been conducted on the capability of LLM to generate
806 critique content for human writings in various scenarios (Tang et al., 2024; Rahman et al., 2023;
807 Lagakis & Demetriadis, 2021; Jong et al., 2023; Lagakis & Demetriadis, 2021). There are also
808 emerging systems built for providing critique generation (Tyser et al., 2024; Peng et al., 2024;
809 Gong et al., 2021; Kumar et al., 2021; Li et al., 2021), manifesting remarkable performance. The
810 primary difference between their work and ours is that their system focuses on generating evaluative
811 comments, whereas we prioritize minimizing hallucinations in the feedback to help writers improve
812 text quality. Also, there lacks of an agreement on a unified testbench.
813

810 **B LIMITATIONS**
811

812 There are two limitations of this work. First, the development of automated hallucination detection
813 techniques for essay critique generation is necessary but requires extensive data labeling, which was
814 constrained by practical budget limitations; thus, we believe it is important to explore synthetic data
815 for the purpose as a focus for future research. Second, exploring how LLM-generated critiques
816 influence LLM-generated essays could deepen our understanding of LLM-based automatic reviews.
817 If successful, it will greatly improve the potential of LLMs for enhancing human-written texts.

818

819 **C CRITERIA FOR ESSAYS**
820

821 **C.1 CHINESE ARGUMENTATIVE ESSAYS**
822

823 The essay content studied in our work exhibits four structural and content characteristics. **Topic**
824 is the background and the author’s core perspective to be delivered in the essay. An essay must
825 have a well-defined topic to discuss. Students need to choose a focused, valuable question from a
826 clearly identified discipline that allows for in-depth discussion. **Literature** is the bridge between the
827 essay and the information outside the essay. It is essential to engage in a thorough discussion about
828 existing literature to clearly understand the issue at hand and cite sources appropriately throughout.
829 **Arguments and Structure** refer to the chain of thoughts that depict how arguments are articulated.
830 When presenting arguments, the structure should follow the “problem-argument-reason-evidence”
831 structure to ensure persuasiveness. Arguments should be clear, well-supported, and employ proper
832 logical reasoning, often utilizing both deductive and inductive methods. **Language and Norms**:
833 First-person pronouns should be avoided, and the arguments must be original. When referring to
834 others’ opinions, it is crucial to paraphrase appropriately and refrain from plagiarism.

835 Student essays are evaluated with respect to the standards uniformly above. We believe such criteria
836 are beneficial for narrowing down possible variances stemming from different assessors’ subjectivity.
837 When evaluating the model’s generated critiques, human labelers can then better focus on
838 hallucinations in the critiques, conditioned on the above criteria.

839 **C.2 ENGLISH CONFERENCE PAPERS**
840

841 Generally, we refer to ICLR 2025 review instructions for details (<https://iclr.cc/Conferences/2025/ReviewerGuide>). We applied the ICLR reviewer guidelines as evaluation criteria. Since ICLR reviewer guidelines have already contained more than 10 questions in it, we replace the guideline questions with description of the expectation for a good conference paper on those questions. The following is the evaluation criteria version without questions we used.

846 1. **Thoroughly Read the Paper:** The paper should be read carefully
847 in its entirety. Related works and citations must be reviewed to
848 ensure a comprehensive evaluation. Sufficient time should be
849 allocated for this process.

850 2. **Key Considerations While Reading:**

852 2.1 **Objective of the Work:** The paper should have a clear goal,
853 such as addressing a known problem or application, highlighting a
854 new issue, or presenting new theoretical findings. Different
855 objectives should be assessed based on their potential value and
856 impact.

858 2.2 **Strong Points:** The submission should be clear, technically
859 correct, experimentally rigorous, reproducible, and present novel
860 findings in areas such as theory or algorithms.

862 2.3 **Weak Points:** Any shortcomings in clarity, technical
863 correctness, rigor, reproducibility, or novelty should be noted.

864 2.4 Open-Mindedness: The value of the paper should be considered
865 from the perspective of the entire ICLR community, even if it may
866 not seem immediately relevant or interesting to individual
867 reviewers.

868
869 3. Evaluating Core Aspects for Recommendation:

870
871 3.1 Problem Definition: The paper should tackle a specific
872 question or problem with clarity.

873
874 3.2 Motivation and Context: The approach should be well-motivated
875 and appropriately contextualized within the literature.

876 3.3 Support for Claims: The paper should provide rigorous evidence
877 to support its claims, ensuring results are both correct and
878 scientifically valid.

879
880 3.4 Significance: The work should contribute new, valuable
881 knowledge to the community, whether empirical, theoretical, or
882 practical, regardless of whether it achieves state-of-the-art
883 results.

884
885 4. Initial Review Structure:

886
887 4.1 Summary: Clearly summarize the paper's contributions in a
888 positive and constructive manner.

889
890 4.2 Strengths and Weaknesses: Identify the paper's strong and weak
891 points comprehensively.

892
893 4.3 Initial Recommendation: Provide an initial recommendation
894 (accept or reject) with a clear rationale.

895
896 4.4 Supporting Arguments: Present evidence and arguments that
897 support the recommendation.

898
899 4.5 Clarifying Questions: Include questions for the authors to
900 address ambiguities and provide additional evidence for the
901 assessment.

902
903 4.6 Improvement Suggestions: Offer constructive feedback aimed at
904 improving the paper. Clarify that these suggestions are for
905 improvement and not necessarily decision-critical.

906
907 5. Complete the CoE report:

908
909 5.1 Familiarize yourself with the ICLR Code of Ethics before
910 starting reviews.

911
912 5.2 Assess whether the paper has potential CoE violations and
913 provide explanations if applicable. The CoE report will involve
914 answering these questions as part of the review process.

915
916 6. Active Participation in Discussions:

917
918 Actively engage in the asynchronous discussion phase, where
919 reviewers, authors, and area chairs exchange feedback. Be open to
920 revising your initial recommendation based on new insights or
921 updates to the submission.

918
919 7. Borderline Paper Discussions:
920
921 Participate in virtual meetings organized by Area Chairs (ACs) to
922 discuss borderline cases. Familiarize yourself with feedback from
923 other reviewers to contribute meaningfully to the discussions.
924 Reviewers who fail to attend without emergencies will have their
925 absence noted.

926 8. Final Recommendation:

928 Update your review to reflect any new information or revisions
929 during the discussion phase. Clearly articulate the reasoning
930 behind your final recommendation, including what influenced any
931 changes to your assessment.

934 With the above criteria, the prompts for English conference paper critiquing is structured as fol-
935 lowed.

937 Suppose you are a professional essay polisher for international
938 conference in learning representation. Based on the following
939 review criteria, provide suggestions to improve the appointed
940 paragraph.

941 [review criteria begins]
942 {criteria}
943 [review criteria ends]

945 [paper begins]
946 {paper}
947 [paper ends]

948 [paragraph begins]
949 {paragraph}
950 [paragraph ends]

952 Now begin your suggestions within 100 words. Your suggestions
953 should aim at pointing out the weaknesses and providing
954 constructive feedback.

957 D DATA PREPARATION

959 We collect over 6,000 student essays from our course archives from Fall 2019 to Spring 2024, and
960 randomly select 50 essays to serve as the test set for our evaluation.

962 Below are our considerations for picking:

963 **Diversity of Topics:** The selected 50 essays cover a broad spectrum of topics, including literature,
964 cultural criticism, gaming industry reviews, electric vehicles, technology, and artificial intelligence.
965 These topics were categorized into distinct thematic groups to ensure a diverse representation of
966 subject matter for our testing.

967 **Content and Instructor Feedback:** All essays were initial drafts submitted by students for one-
968 on-one feedback from their course instructors. The instructors provided paragraph-level comments,
969 primarily focusing on the writing issues and offering suggestions for improvements.

971 **Ethics and Privacy Considerations:** To ensure the ethical use of student data, we obtained approval
972 from the course teaching team for the use of these essays. Additionally, all essays were anonymized

972 by removing personal identifiers such as student names, IDs, locations, and any other sensitive
973 information. We applied standard anonymization techniques to ensure privacy and a manual review
974 was conducted to confirm that no personal information remained in the dataset.

975 **De-noising:** We apply format-revision and correction to the the essays. We also filter out very casual
976 teacher comments like single punctuation like '?', or commenting on unrecognizable pieces.
977

978 979 E ESSAY READING QUESTION LIST 980

981 E.1 QUESTIONS FOR CHINESE ARGUMENTATIVE ESSAYS 982

983 We list the questions in Table 8 that we collected from the essay writing experts. They are cru-
984 cial questions in understanding an essay. The picking threshold is the agreement over 15 TAs and
985 instructors.
986

988 Setting	989 Prompt
989 Question 1	990 文章是否有一个明确的主题或中心思想? 990 Does the article have a clear theme or central idea?
991 Question 2	992 作者在文章的开头是否清晰地提出了主要观点或论点? 992 Does the author clearly present the main point or argument at the beginning of the article?
993 Question 3	994 作者是否清晰地表达了他们的观点, 且这些观点在文章的各部分中得到一致的支持和阐述? 994 Has the author articulated their views clearly, with consistent support and elaboration throughout the various sections of the article?
995 Question 4	996 这些观点是否贯穿全文, 有没有与主题无关的内容? 996 Are these viewpoints consistently maintained throughout the text, or is there unrelated content?
997 Question 5	998 文章是否深入探讨了主题, 提供了有力的论据和例子来支持观点? 998 Does the article delve deeply into the subject, providing strong evidence and examples to support its arguments?
999 Question 6	1000 作者是否展示了对题目有深刻的理解和分析, 还是仅仅停留在表面? 1000 Does the author demonstrate a profound understanding and analysis of the topic, or do they merely scratch the surface?
1001 Question 7	1002 作者在文章中是否深入分析了主题, 提供了充分的论据、例子和细节来支持他们的观点? 1002 Has the author thoroughly analyzed the theme within the article, offering ample evidence, examples, and details to back up their points?
1003 Question 8	1004 有没有考虑到不同的视角或反驳意见, 并且对这些进行了回应? 1004 Have different perspectives or counterarguments been considered, and have these been adequately addressed?
1005 Question 9	1006 文章中的语言是否清晰、准确且具有表现力? 1006 Are the statements in the article clear, accurate, and expressive?
1007 Question 10	1008 语言风格是否与文章的目的和受众相匹配? 1008 Does the writing style align with the article's purpose and audience?
1009 Question 11	1010 文章是否有明显的语法、拼写或标点错误? 这些错误是否会干扰读者的理解或降低文章的专业性和可信度? 1010 Are there noticeable grammatical, spelling, or punctuation errors in the article? Do these errors hinder the reader's under- standing or diminish the professionalism and credibility of the piece?
1011 Question 12	1012 文章是否提出了独特的见解或创新的观点, 或者只是重复了常见的观点? 1012 Does the article present unique insights or innovative viewpoints, or does it merely reiterate common ideas?
1013 Question 13	1014 有没有引入新颖的例子或视角来讨论主题, 从而使文章在众多类似文章中脱颖而出? 1014 Has the author introduced novel examples or perspectives to discuss the theme, allowing the article to stand out among similar works?
1015 Question 14	1016 文章的结构是否合理? 1016 Is the structure of the article logical?
1017 Question 15	1018 段落之间的衔接是否流畅? 1018 Is there a smooth transition between paragraphs?
1019 Question 16	1020 作者是否按照一个清晰的逻辑顺序来组织他们的论点和证据? 1020 Does the author organize their arguments and evidence in a clear logical sequence?
1021 Question 17	1022 每一段是否都有一个明确的中心思想, 并且与前后的段落自然衔接? 1022 Does each paragraph have a distinct central idea that connects naturally with the preceding and following paragraphs?
1023 Question 18	1024 段落之间是否有过渡句来帮助读者理解文章的整体结构? 1024 Are there transitional sentences between paragraphs to assist the reader in understanding the overall structure of the article?

1025 Table 8: Crucial questions list for EssayC.

1026 **E.2 QUESTIONS FOR ENGLISH ARTIFICIAL INTELLIGENCE CONFERENCE PAPERS**

1027
1028 We select the question list from the ICLR guideline and list them in Table 9.

Setting	Prompt
Question 1	What is the goal of the paper?
Question 2	Is it to better address a known application or problem, draw attention to a new application or problem, or to introduce and/or explain a new theoretical finding? A combination of these?
Question 3	Is the submission clear, technically correct, experimentally rigorous, reproducible, does it present novel findings (e.g. theoretically, algorithmically, etc.)?
Question 4	What is the specific question and/or problem tackled by the paper?
Question 5	Is the approach well motivated, including being well-placed in the literature?
Question 6	Does the paper support the claims?
Question 7	Are results, whether theoretical or empirical, correct and scientifically rigorous?
Question 8	What is the significance of the work?
Question 9	Does it contribute new knowledge and sufficient value to the community?
Question 10	Does the paper convincingly demonstrate new, relevant, impactful knowledge (including empirical, theoretical, for practitioners, etc.)?
Question 11	What questions would you like answered by the authors to help you clarify your understanding of the paper and provide the additional evidence you need to be confident in your assessment?
Question 12	Is there a potential violation of the Code of Ethics (CoE)?
Question 13	If there is a potential violation, why might there be a potential violation?

1049 Table 9: Crucial questions list For English artificial intelligence conference papers.

1050
1051 **F DETAILS FOR TRAINING AND IMPLEMENTATIONS**

1052 **F.1 SUPERVISED FINETUNING**

1053 **F.1.1 DATA PREPARING**

1054 We conducted our supervised finetuning over augmentation of teachers' original comments from historical archives apart from the test set. We found original teachers' comments are informal and fragmented, and directly finetuning on them causes damage to the LLM's performance. Therefore, we extracted teachers' comments and deployed a GLM-4-130B for augmentation. The aim of augmentation is to rewrite the semantically low-quality comments into fluent ones, easing for LLM to fit on. The prompt for augmentation can be found in Appendix I.

1055 As a result, we adopt 31,694 polished human paragraph-level critiques as training data, excluded from the EssayC testset split mentioned in Section 2. The format of the data is arranged into (evaluation prompt, essay, and target paragraph) as input, and polished paragraph as output. The train and valid set are split based on essays to avoid potential leakage.

1056 **F.1.2 TRAINING DETAILS**

1057 We split the data into training and validation sets with a 0.95:0.05 ratio. The training epoch is set as 1.15, for from empirical observation, the lowest loss on the validation set falls around epoch 1.1 to 1.2. We adjust learning rate from {1e-5, 2e-5, 3e-5, 5e-5, 1e-4}, weight decay rate {1e-3, 1e-2}, betas for Adam {[0.9, 0.999], [0.9, 0.9]}, scheduler between {linear, cosine}. Finally, we pick the following config for the least evaluation loss. The training is implemented with LLaMA-Factory (Zheng et al., 2024b).

- 1058 • per_device_train_batch_size: 1
1059 • gradient_accumulation_steps: 2
1060 • learning_rate: 1.0e-5
1061 • weight_decay: 0.01

```

1080     • adam_beta1: 0.9
1081     • adam_beta2: 0.999
1082     • max_grad_norm: 1.0
1083     • num_train_epochs: 1.15
1084     • lr_scheduler_type: cosine
1085     • warmup_ratio: 0.1
1086
1087
1088 F.2 POST TRAINING
1089
1090 F.2.1 DATA PREPARING
1091
1092 As for post-pretraining, we follow two steps: (1) pre-training on Chinese academic papers in the
1093 field of literature, social science and humanities and (2) followed by SFT on the previous data to
1094 ensure the alignment of the critiquing task.
1095 We crawled 128,321 academic papers from the Chinese National Social Science Base. The papers
1096 mainly come from journals, such as Exploration and Free Views, Fiction Monthly Shanghai Literature,
1097 Beijing Literature Novella Month, Science Technology Critiques, Tanzen Technology Review
1098 and so on. We use OCR with doc2x API (https://v2.doc2x.noedgeai.com) and applied the follow-up
1099 data filter and typo fixing with GPT-4 and GLM-4. The above process produces 27,430 pure text
1100 papers of an average around 30,000 Chinese characters. The whole tokens surpassed 1.5 billion.
1101
1102 F.2.2 TRAINING DETAILS
1103
1104 We split the data into training and validation sets with a 0.95:0.05 ratio. The training epoch is set as
1105 6.0, for from empirical observation, the lowest loss on the validation set falls around epoch 5.0 to
1106 7.0.
1107 We adjust learning rate from {1e-5, 2e-5, 3e-5, 5e-5, 1e-4}, weight decay rate {1e-3, 1e-2}, betas
1108 for Adam {[0.9, 0.999], [0.9, 0.9]}, {linear, cosine}. Finally, we pick the following config for the
1109 least evaluation loss. The training is implemented with LLaMA-Facotory (Zheng et al., 2024b).
1110     • per_device_train_batch_size: 1
1111     • gradient_accumulation_steps: 1
1112     • learning_rate: 3.0e-5
1113     • weight_decay: 0.01
1114     • adam_beta1: 0.9
1115     • adam_beta2: 0.999
1116     • max_grad_norm: 1.0
1117     • lr_scheduler_type: cosine
1118     • warmup_ratio: 0.1
1119     • bf16: true
1120
1121
1122
1123 F.3 FEW-SHOT IMPLEMENTATION
1124
1125 In our experiment, we experimented with 5-shot structure to test its feasibility to handle the task.
1126 The structure of 5-shot is listed as follows. Note that the beginning of the prompts and the ending of
1127 the prompts remain the same as prompts for baseline-LLM inference in Table 10. The only change
1128 is the insertion of the five examples.
1129
1130
1131 [Evaluation Prompt begins and ends]
1132
1133 Explanation of the criteria.

```

1134 [Evaluation Criteria begins and ends]
1135
1136 Explanation of the essay.
1137
1138 [Target essay begins and ends]
1139
1140 Explanation of paragraph.
1141
1142 [Target Paragraph begins and ends]
1143
1144 There are five examples for your critiques. You can refer to them
or mimic.
1145
1146 [Example 1 begins]
1147 Target Essay 1
1148 Paragraph 1
1149 Critique 1
1150 [Example 1 ends]
1151
1152 [Example 2 begins]
1153 Target Essay 2
1154 Paragraph 2
1155 Critique 2
1156 [Example 2 ends]
1157
1158 [Example 3 begins]
1159 Target Essay 3
1160 Paragraph 3
1161 Critique 3
1162 [Example 3 ends]
1163
1164 [Example 4 begins]
1165 Target Essay 4
1166 Paragraph 4
1167 Critique 4
1168 [Example 4 ends]
1169
1170 [Example 5 begins]
1171 Target Essay 5
1172 Paragraph 5
1173 Critique 5
1174 [Example 5 ends]
1175
1176 Now, please provide your evaluation. Note that although five
aspects are listed in the evaluation criteria, you only need to
evaluate one dimension based on the
1177 most prominent feature in the paragraph. In your evaluation,
please integrate your notes to grasp the overall framework,
thought process, and logic of the article. Your feedback should
help the student improve the quality of the paragraph. If there
1178 are issues, please point them out and offer suggestions for
improvement. Please respond with your feedback directly without
1179 using formalities, and your evaluation should not exceed 100 word.
1180
1181
1182
1183
1184
1185
1186
1187

	Mode	Win	Tie	Lose
Pair A	Forward	0.16	0.01	0.82
	Reverse	0.19	0.02	0.80
	Average	0.18	0.02	0.81
Pair B	Forward	0.24	0.01	0.76
	Reverse	0.45	0.01	0.54
	Average	0.34	0.01	0.65
Pair C	Forward	0.68	0.00	0.32
	Reverse	0.80	0.00	0.20
	Average	0.74	0.00	0.26
Pair D	Forward	0.46	0.02	0.52
	Reverse	0.63	0.01	0.36
	Average	0.55	0.01	0.44

Figure 5: **Position Bias** by GPT evaluator. **Forward** shows that critique A is posited far from the end of the prompt while **Reverse** is the opposite case. The scores we reported are the algorithmic average of the two modes.

G POSITION BIAS OF THE EVALUATOR

We observe significant position bias on the pairwise scoring of GPT-4o-mini. As we find in Table 5. We compared four settings from top to down:

- GPT-4o-mini-0718 V.S. GPT-4o-mini-0718-RedHat
- glm-4-9b-chat V.S. glm-4-9b-chat-RedHat
- glm-4-9b-chat V.S. glm-4-9b-chat-RedHat-weak
- glm-4-9b-chat-sft V.S. glm-4-9b-chat-sft-RedHat

As the table showed, GPT showed a significant preference on the item that is near to the end of the prompt (**Revser**e). Previous works in multiple choices (Zheng et al., 2023) also discussed such a phenomenon.

H HUMAN ANNOTATION

H.1 WRITING EXPERT INFORMATION

We hired 15 writing experts for the human annotation stage. They are serving as teaching assistants in the undergraduate writing course. The group primarily consists of graduate students and advanced undergraduates (juniors and seniors), representing a diverse range of academic departments. This interdisciplinary composition ensures the accessibility and relevance of articles across various disciplines and research topics.

H.2 ANNOTATION GUIDELINE TRANSLATED

The following verbatim is our annotation document for human expert annotators. The original document is in Chinese and we translate it into English.

Evaluation Scoring and Annotation Guidelines Document (For critque quality evaluation)

I. Task Description & Objectives

1242 The model is tasked with evaluating human-written paragraphs.
1243 However, due to limitations in the model's capabilities, the
1244 evaluation may produce instances of hallucination and other
1245 issues. The core objective of this task is to assess the overall
1246 quality of the model's comments based on specific dimensions and
1247 to conduct preference scoring and comparison.

1248 In a given essay, multiple comments are provided for a particular
1249 paragraph. Our tasks are as follows:

- 1251 1. Scoring { Evaluate the quality of comments based on three
1252 dimensions (hallucination, detail, and informativeness) and assign
1253 scores accordingly.
1254
- 1255 2. Subjective Ranking { Subjectively rank the quality of selected
1256 pairs of comments.

1257 II. Data Field Description

1259 Fixed Fields

1261 - Original Text: The original essay is in document format, which
1262 can be accessed for viewing (annotations from the instructor can
1263 be seen after downloading).

1265 - Original Paragraph: The paragraph being evaluated by the model,
1266 sourced from a specific section of the paper.

1268 - Comments A | H | C | G | I | D | E | F: Eight different model
1269 comments on the original paragraph, including opinions on
1270 structure, content, and format.

1271 Annotation Fields

1273 - Scores for Comments A | H | C | G | I | D | E | F: Score +
1274 corresponding deduction reasons (drop-down list) + 4 sets of
1275 preference comparisons, totaling 20 points.

1277 1. Comment Scoring (8 scores + corresponding multiple-choice
1278 reason boxes):

1280 - Each comment is scored out of a maximum of 5 points, with
1281 deductions made based on error types; specific rules can be
1282 found in STEP 3.

1283 2. Preference Selection (4 single choices):

1285 - A & H Comment Comparison: Preference comparison between
1286 comments A and H.

1288 - C & G Comment Comparison: Preference comparison between
1289 comments C and G.

1291 - C & I Comment Comparison: Preference comparison between
1292 comments C and I.

1293 - D & E Comment Comparison: Preference comparison between
1294 comments D and E.

1296 Preliminary Notes:
1297

1298 The order in the multi-dimensional table from left to right will
1299 follow the sequence:
1300

1301 A, H, C, G, I, D, E, F. Reading from left to right generally does
1302 not require looking back. Note that preference comparisons will be
1303 interspersed throughout.

1304 Scoring is supported by objective dimensions, but these dimensions
1305 may not always correspond directly to the actual quality of the
1306 comments. Preference selection can include subjective factors,
1307 allowing evaluators to choose the most helpful comment between two
1308 options.
1309

1310 III. Specific Scoring Rules (Deduction System)
1311

1312 Scores will be assigned based on the following three dimensions,
1313 with a total score of 5 points, deducting down to 0 points. If the
1314 final score is 5 (full score) and there are no other deduction
1315 points, please check the box for constructive feedback (add 1
1316 point) to provide a reason for the full score.

1317 Dimension 1: Hallucination
1318

1319 - A single hallucination error results in a deduction of 2 points,
1320 two errors lead to a 3-point deduction, and more than two errors
1321 lead to a 4-point deduction. The following rules were previously
1322 detailed in the pre-annotation documentation regarding
1323 hallucination classification:
1324

1325 1. Ignoring Context and Multimodal Information
1326

1327 - Explanation: While the entire paper may not provide this
1328 information, it can be inferred from the feedback given by
1329 human authors whether the model's comments overlook contextual
1330 text information or multimodal information (such as images or
1331 links).
1332

1333 - Typical Context Issues: The author may have presented a
1334 viewpoint or concept in the surrounding context that the model
1335 fails to recognize. This is easily identified with human
1336 feedback, but without it, relevant contextual information must
1337 be judged.
1338

1339 - Multimodal: When the model evaluates articles that combine
1340 text and images, it may fail to effectively parse and integrate
1341 the meanings of the illustrations within the text, leading to
1342 deviations or errors in assessing the relationships between
1343 text and images.
1344

1345 2. Vocabulary, Grammar, and Punctuation Correction Hallucinations
1346 (Overcorrection, Errors)
1347

1348 - The model may provide unnecessary overcorrections regarding
1349 ordinary vocabulary and grammar in the paper|for example,
1347 demanding an explanation for a simple word and providing
examples.

-
- 1350 - Corrections made to punctuation and grammar may be incorrect.
1351
1352 - Sentences that lack fluency should be categorized in this
1353 group.
1354
1355 3. Misunderstanding Concepts, Viewpoints, and Logical Structures
1356
1357 - Failure to recognize or understand the main viewpoints,
1358 concepts, and logical structures expressed by the author in the
1359 paragraph, yet proceeding to make corrections.
1360
1361 4. Content Structure – Overcorrection of Non-Key Information
1362
1363 - Requires thorough reading and understanding of the original
1364 paragraph's theme and arguments, assessing whether the model
1365 displays the following issues:
1366
1367 1. Failure to correctly identify the main argument of the
1368 paragraph, resulting in corrections that do not align with
1369 the actual situation.
1370
1371 2. Proposing expansions or corrections that focus on
1372 non-essential information.
1373
1374 3. Errors in summarizing the author's viewpoint.
1375
1376 4. Misunderstanding of the inter-paragraph relationships at
1377 the chapter level.
1378
1379 5. Proposing additions or expansions due to a failure to
1380 differentiate between the author's argumentation logic and
1381 specific concepts.
1382
1383 5. Citation-Related Errors|Content Formatting Comments
1384
1385 - The model may encounter the following hallucinatory issues
1386 regarding citations in the paper:
1387
1388 1. Incorrectly treating a citation as an evaluation target.
1389
1390 2. Failing to recognize or incorrectly identifying citation
1391 information.
1392
1393 3. Guiding errors in citation formatting.
1394
1395 4. Incorrectly assuming that there is citation information
1396 when the original text does not provide any.
1397
1398 Dimension 2: Detail Level
1399
1400 - Deductions of 1 point will be applied for vague evaluations.
1401
1402 - Vague evaluations:
1403 - Comments provided by the model are overly generic and lack
1404 substantial content, making them applicable in any context.
1405
1406 Dimension 3: Constructiveness

-
- 1404 - Constructive feedback adds 1 point; lack of substantial help
1405 results in a deduction of 1 point.
1406
- 1407 - Note: If a comment has no issues and is constructive, it can
1408 still receive a score of 5.
1409
- 1410 - Evaluation lacking helpfulness:
1411
- 1412 - The model's comments do not offer constructive suggestions
1413 that would aid in improving the paper, resulting in a deduction
1414 of 1 point.
1415
- 1416 - It is important to distinguish the constructiveness dimension
1417 from the hallucination dimension: having hallucinations does not
1418 automatically warrant a deduction for constructiveness. If the
1419 AI provides helpful suggestions for improving the paper, then no
1420 deduction is necessary; however, if the AI misleads the reader,
1421 then a deduction should be applied.
1422
- 1423 - Care should be taken to avoid double deductions stemming from
1424 hallucination issues that lead to a lack of helpfulness.
1425
- 1426 - If the comments provided by the model are highly beneficial for
1427 the improvement of the paper, an additional point can be awarded
1428 based on this dimension.
1429

1430 The following is the document for preference picking on polished essays.
1431

1432 I. Task Description & Objectives
1433

1434 People can polish articles of varying quality by following
1435 different types of comments. The core of this task is to score
1436 preferences of the polished text according to specific dimensions
1437 based on the comments.
1438

1439 II. Data Field Description
1440

1441 Fixed Fields
1442

1443 - Original Text: The original essay is in document format, which
1444 can be accessed for viewing (annotations from the instructor can
1445 be seen after downloading).
1446

1447 - Original Paragraph: The paragraph being evaluated by the model,
1448 sourced from a specific section of the paper.
1449

1450 - Polishing A | H | C | G | I | D | E | F: The polished based on
1451 the original text and original paragraph, which are to be
1452 evaluated.
1453

1454 Annotation Fields
1455

1456 1. Preference Selection (3 single choices, win / lose / good tie /
1457 bad tie):
1458

1459 - A & H Polishing Comparison: Preference comparison between
1460 polishings A and H.
1461

1458
1459 - C & G Polishing Comparison: Preference comparison between
1460 polishings C and G.
1461
1462 - A & J Polishing Comparison: Preference comparison between
1463 polishings A and J.
1464
1465 2. Selection Reasons for Preference (choose from 1-5. Please refer
1466 to Section III for detailed information.)
1467
1468 III. Criteria for Preference Selection
1469
1470 The following describes the characteristics of high-quality
1471 polishing:
1472 1. Adaptability to the Original Text (Original Structure):
1473 - When the polished paragraph is inserted into the article,
1474 does it align with the main flow of the original text, without
1475 deviating in the logical chain?
1476 - The viewpoint of the polished paragraph should not
1477 contradict any content already present in the original text.
1478
1479 2. Language Characteristics:
1480 - Does it comply with the writing norms taught in our writing
1481 courses?
1482
1483 3. Argumentation Process:
1484 - Whether the development of the polished paragraph follows
1485 the required "tree structure", problem, viewpoint, reasons,
1486 and evidence.
1487 - Regardless of the complexity of the viewpoint, whether the
1488 viewpoint information is effectively conveyed to the reader?
1489
1490 4. Literature and Examples:
1491 - Avoid irresponsible citations, incorrect citations,
1492 counterfactual references, or irrelevant citations.

Setting	Prompt
1512	
1513	
1514	Chinese prompt
1515	你是一位专业的写作老师，你正在教授一位同学论述性写作，同学提交了他的论文草稿，请你根据你制定的以下标准，对论文草稿中的一段话进行点评。 [评价标准开始]
1516	选题要求 * 选题基于明确的研究空白； * 需具备学理深度、新颖性和研究价值； * 研究对象和视角应聚焦明确。
1517	文献使用 * 文献检索应充分且符合CRAAP原则（时效性、相关性、权威性、准确性、无利益冲突）； * 根据具体研究问题平衡使用前沿文献和经典文献； * 与文献进行充分对话，深入理解选题及方法，合理运用文献进行观点论证。
1518	观点论证 * 观点明确，论据充分； * 论证逻辑严密，结合演绎与归纳，呈现清晰的树形结构和塔式积木式的证据链。
1519	结构组织 * 内容有清晰的主线，条理分明； * 概念、框架应前后一致，文内合理呼应； * 通过标题、段首词句衔接，实现流畅过渡； * 论点前置，吸引读者，回答“为什么写、写了什么、怎么写”； * 结尾自然，无不必要的评论或总结。
1520	规范与语言 * 遵守学术规范，论证应为原创，合理引用而非照搬； * 排版整洁，符合模板要求，引用符合标准格式； * 语言准确、简洁、理性，避免使用个人化表达。
1521	[评价标准结束]
1522	以下是是学生的作文，你需要先阅读并理解其内容。
1523	[学生作文开始] {essay} [学生作文结束]
1524	下面是需要你评价的局部段落，请你在评价的时候定位其在文章中的位置。
1525	[待评价段落开始] {paragraph} [待评价段落结束]
1526	现在请开始你的评价。请注意，评价标准中列出了5点要求，但是你只需要根据待评价文段中最明显的特征，在选题要求、文献使用、观点论证、结构组织、规范与语言中选取一个维度进行评价即可。你的评价旨在帮助学生提升待评价段落的质量，如果待评价段落中存在问题，请将其指出，并且提供改进建议。请直接回复你的评价，不要套话。你的评价不要超过100字。

1539	English translation
1540	You are a professional writing instructor teaching a student argumentative writing. The student has submitted a draft of their essay. Based on the following criteria, please provide feedback on a specific paragraph from the draft.
1541	[Evaluation Criteria Begins]
1542	Topic Selection Requirements
1543	- The topic should be based on a clear research gap. - It should have academic depth, novelty, and research value. - The research object and perspective should be focused and specific.
1544	Use of Literature
1545	- The literature search should be thorough and meet the CRAAP principles (Currency, Relevance, Authority, Accuracy, and Purpose). - Use a balanced mix of cutting-edge and classic literature, depending on the research question. - Engage deeply with the literature to understand the topic and methodology, and use it appropriately to support arguments.
1546	Argumentation
1547	- The argument should be clear, with sufficient evidence. - The logic should be rigorous, combining deduction and induction, presenting a clear tree structure and a block-by-block evidence chain.
1548	- Structure and Organization
1549	The content should follow a clear main line, well-structured. - Concepts and frameworks should be consistent and logically referenced throughout the essay.
1550	- Smooth transitions should be achieved through appropriate use of headings and introductory phrases. - The thesis should be upfront, engaging the reader, answering “why write, what is written, how it is written.”
1551	- The conclusion should be natural, without unnecessary commentary or summary.
1552	Academic Norms and Language
1553	- Follow academic standards; arguments should be original, with proper citation instead of paraphrasing or copying. - The formatting should be neat, adhering to template requirements, and citations should follow the correct format. - The language should be accurate, concise, and objective, avoiding personal expressions.
1554	[Evaluation Criteria Ends]
1555	Here is the student's essay; please read and understand its content first.
1556	[Student Essay Begins] {essay} [Student Essay Ends]
1557	
1558	Below is the specific paragraph to be evaluated. When providing feedback, please identify its position in the essay.
1559	[Paragraph to be Evaluated Begins] {paragraph} [Paragraph to be Evaluated Ends]
1560	
1561	
1562	Now, please provide your evaluation. Note that although five aspects are listed in the evaluation criteria, you only need to evaluate one dimension based on the most prominent feature in the paragraph. Your feedback should help the student improve the quality of the paragraph. If there are issues, please point them out and offer suggestions for improvement. Please respond with your feedback directly without using formalities, and your evaluation should not exceed 100 words.

1756	Please act as a professional paper reviewer and assess the quality of different revisions of a paragraph based on your understanding of the paper. First, read the following text.
1757	[Article begins] {essay} [Article ends]
1758	Below is a pair of revisions compared to the original paragraph. Please determine which revision has better quality. The quality of the revisions is primarily evaluated based on:
1759	1. Whether the placement of the revisions within the original text is coherent and reasonable, maintaining a clear flow of ideas;
1760	2. The absence of obvious factual errors or inappropriate arguments;
1761	3. The enhancement of the overall structure of the paper without significantly deviating from the original main line.
1762	[Paragraph begins] {paragraph} [Paragraph ends]
1763	[Revision result 1 begins] {polish1} [Revision result 1 ends]
1764	[Revision result 2 begins] {polish2} [Revision result 2 ends]
1765	You need to provide one of four judgments: 1 is better; 2 is better; 1 and 2 are equally good; 1 and 2 are equally poor. Please enclose your answer in double brackets, such as “[1 is better]” or “[2 is better]”. Please provide your judgment directly.
